

Strict 1-2-3

Now available as a self-teaching manual or Computerized Program.

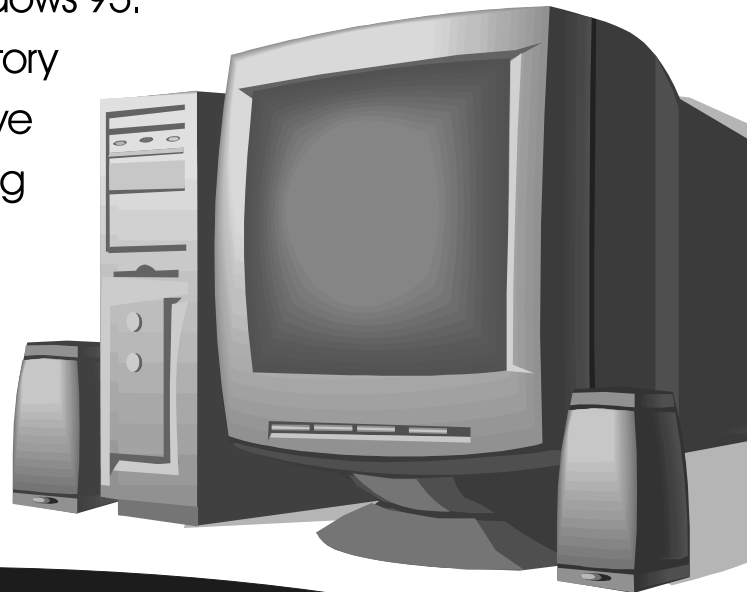

Sperm morphology (Strict Criteria) has proved to be the single most important semen parameter to predict fertility rates and pregnancy outcome in assisted reproduction.

General demand has urged development of a self-teaching program which will enable you to evaluate sperm morphology according to Strict Criteria.

The program, known as Strict 1-2-3®, consists of computer software plus a laboratory manual and 5 microscope slides each containing different sperm populations.

The software version of Strict 1-2-3® contains a complete automated tutorial and technician-test database program. This includes the same information as the manual program with a set of 5 reference slides which further enhance the training and understanding of Strict Criteria." This program requires DOS 5 or higher, VGA graphics, 386 or higher or Windows 95.

The manual program consists of a laboratory teaching guide which contains illustrative information on sperm cells utilizing varying degrees of sperm-morphologic populations.
